

## FACTSHEET SEMPERGREEN® GREENSTAKE

### MATERIAL

A GreenStake is a 100% biodegradable locking pin and made from plant-based material derived from wheat and potato starches. Natural micro-organisms in the ground cause the complete biodegradation of a GreenStake.

A GreenStake has been designed to maintain holding power for over 18 months before biodegrading. The vegetation blankets are sufficiently rooted and anchored within that time.

GreenStakes have 45% more holding power than metal pins, among other things by barbs on the end of a GreenStake.

### APPLICABILITY

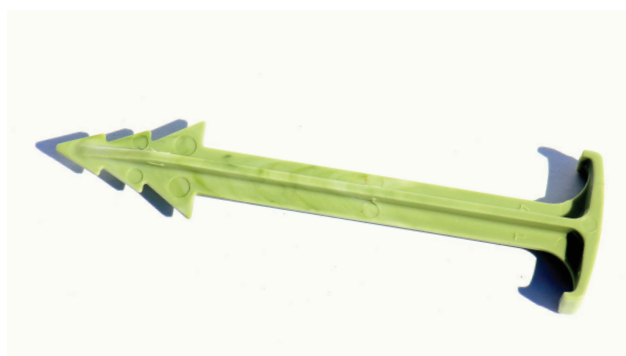

GreenStakes are especially applied in fastening the entire system in slopes and embankments and to avoid shifting.

### DELIVERY AND INSTALLATION

A GreenStake can be ordered by piece.

Put GreenStakes through the blankets (and any possible anti-rooting ground cloth) into the soil to keep it in place.
