

FACTSHEET SEMPERGREEN[®]

AA-GRID TYPE 4

MATERIAL

The Anti-Shear (AA)-grid is made of polypropylene.

APPLICABILITY

The AA-grid type 4 is applicable on very sloping surfaces and roofs, or on roofs at height with high wind exposure. The AA-grid can be used to prevent the vegetation blankets from sliding off and blowing up.

DELIVERY AND INSTALLATION

The AA-grid can be calculated per m².

The AA-grid must be stretched over the vegetation blankets to prevent sliding off and/or blowing up. By using cable ties, the AA-grid can be attached to the roof edge profiles, so that the AA-grid remains in place. For extra fixing it is also possible to run the AA-grid through the gravel or the tiles along the edge.
